Project Brief Mobile iOS & Android
Royal Crown Insurance

Notes Mobile App:
Google Maps integration
Users can send pictures of where they are
Call Royal Assist

Modules:
About Us / Royal Assist / Royal Payments / Services / What To Do If / About Us

We need to create a mobile app for iOS and Android.
Current app link:
https://itunes.apple.com/cy/app/royal-crown-insurance/id675987633?mt=8
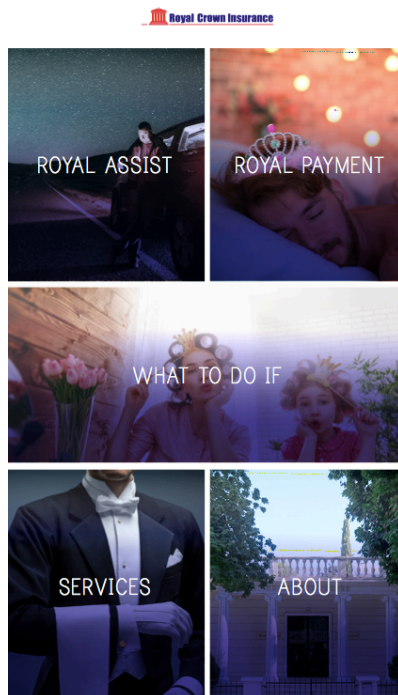

Detailed Brief:

The app should have a main menu with all the modules. The UX should be every easy to navigate and should have a great feel about it. In the app there needs to be an added value.
Modules included on the app:
Home: Our main home page:

Royal Assist: When users tap on the Royal Assist this page will open (below).
When they tap on the *Report an accident* a new tab will open where they can take a picture (like snapchat). They can take pictures and then tab on *DONE* when they move to the next

page they will have the form to fill in (their name, car reg and tell number). Tell numbers should be 8 digits numbers. This form will be send to an email address / our database. When they tap on *Make A Call* then this number (77777773) should be dialled from their mobile phone.

*About Royal Assist:* A page with text about their service.
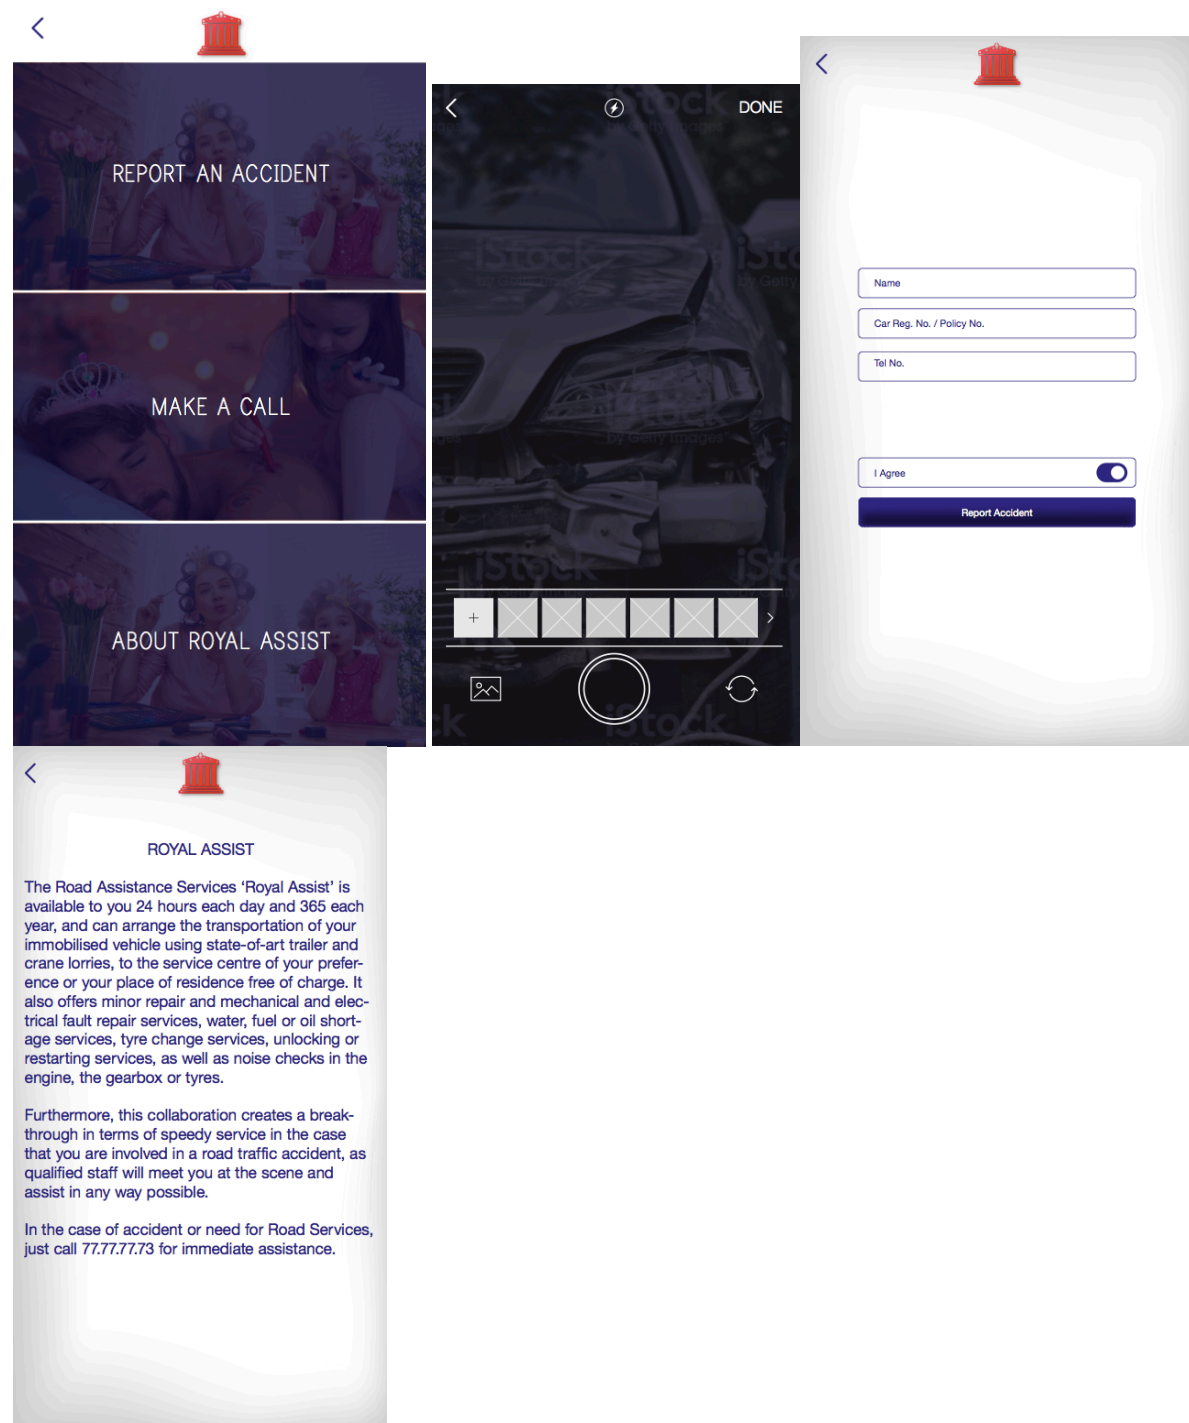

Royal Payments: When users tap on make payments module on the screen we need to have a 'link' where they will tap and it will take them to JCC (external website) where they will be able to make a payment. The payments are not connected to the app, so when they pay it's an external website that does all the payments.

Link for the payments: https://www.jccsmart.com/eBills/Welcome/Index/9634031

Services: On this module when users tab on Services they will have an option to tap on Business or Personal.

When they tap on personal they will have all their services. The same goes for business. When they tap on any service business or personal we will have text and the header for their service. You can write dummy text for all services and then we will edit it from the admin panel and copy paste it from their website.
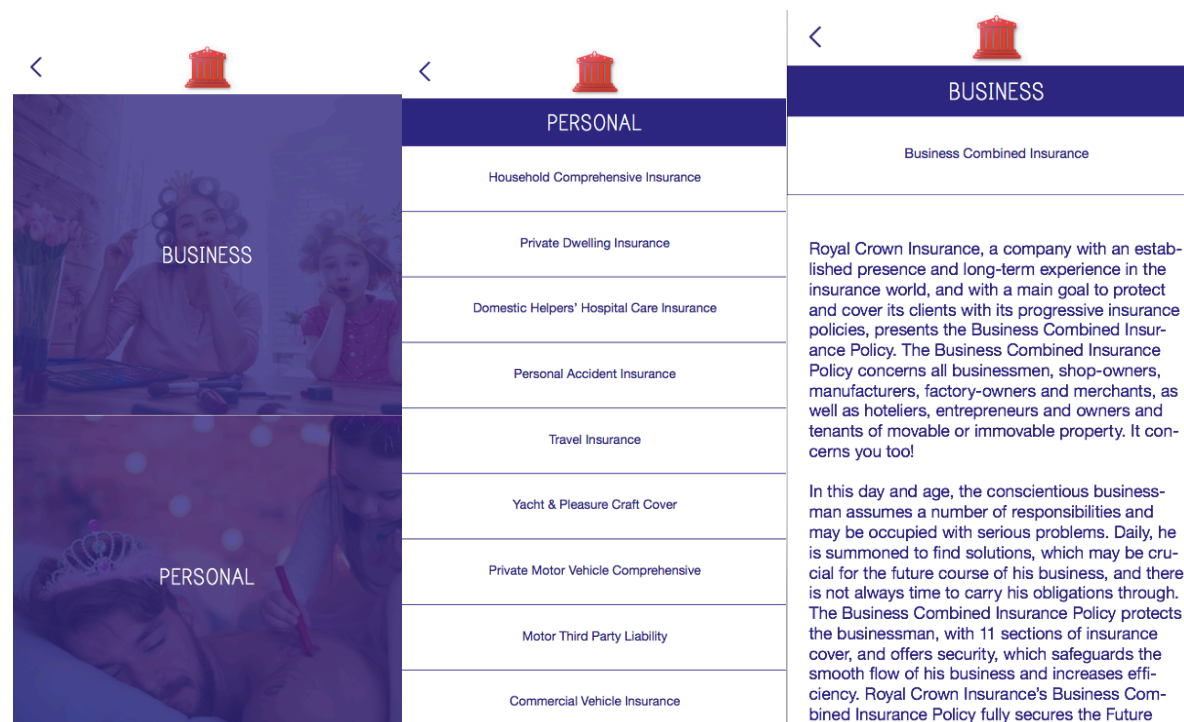

**What to Do If:** Under this module we need to have the following options;

In case of: A Fire / AN earthquake / A Flood / A Burglary / Freezing Temperatures / An Accident At Your Premises / A road traffic accident.
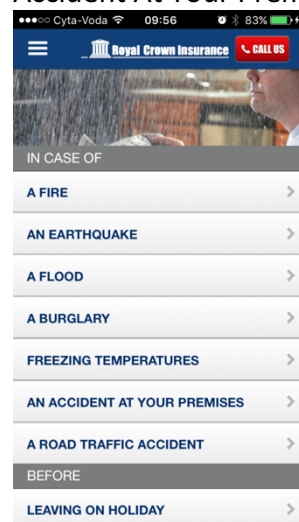

So when users tap on WHAT TO DO IF -> *Fire* (for example) users will be able to see the subcategories and they all will have the same structure as the *FIRE* above.

When they tap on what do to if *Flood / Earthquake / Burglary / Freezing*

We did the design for in case of fire, you can follow the same design for the rest of options. Just add dummy text and we will add content.
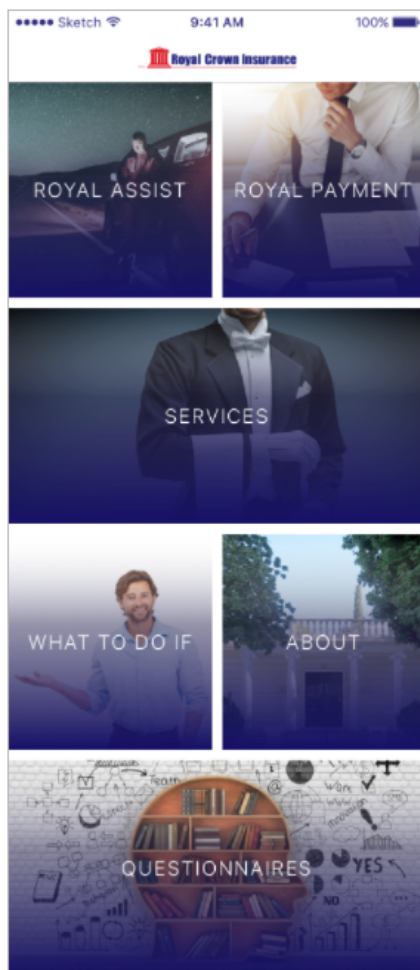

FIRE

In open air | In our home

1. We never throw out cigar butts from our car or while walking. Too many fires have been caused this way and whole forests have been burnt down because of this kind of criminal recklessness. If you notice something, you should immediately report it on phone nos 112 or 199.

2. Other serious causes of fire damage in the open are field scorching and draff burning. In case you see something 'suspicious', you should immediately report on phone nos 112 or 199.

About Us: On this module we need to have our branches, About Us, and E-Ensured. For Branches we need to have intergraded Google Maps with our brances, for About us we need to have text and an image and for e-ensured a button that will take them to the browser and a picture.
